Download

Release 5 For each font, we identify and extract characters from the font face. Then, we convert these characters to numbers, and for each character, we count how many of them are in each line of the text. The following example uses the LikertScale function, to create an ordered scale, where each value from the lowest to the highest has equal distance.

```
graphics.font.createFont( 'Arial', 10 ); var result = graphics.font.measureText('Happy Birthday'); var myScale =  
graphics.LikertScale.create( [0,20,40,60,80,100,120,140,160,180] ); var labels = graphics.font.extractText.labels;  
labels.toSortedVector(); labels.addColumn(myScale.labels); graphics.font.measureText(labels); This should be something like  
this: 82157476af
```
